

Organisational Support for Chapter 100 – A Shared Knowledge Infrastructure for Positive, Local Food Systems

This Letter of Intent is signed on behalf of the organisation named below by an authorised representative. It expresses organisational support for the careful development of Chapter 100 and an Ethical Artificial Intelligence (EAI). It does not create any financial obligation, membership obligation, exclusivity, data-sharing obligation, transfer of rights, or legally binding cooperation agreement. Any concrete project, funding, knowledge contribution, partnership, or use of organisational materials will be agreed separately in writing.

Our organisation supports the vision of Chapter 100 as a shared knowledge infrastructure for Positive, Local Food Systems in Europe.

Valuable knowledge already exists in farms, communities, regional initiatives, research projects, food networks, cultural traditions, and the lived experience of countless people. Much of it is fragmented, difficult to access, or at risk of being lost over time.

Chapter 100 aims to connect this knowledge without removing it from its source. The intention is not to absorb organisational or scientific knowledge into one central voice, but to create a shared space in which origins, authorship, institutional context, and differing perspectives remain visible and traceable.

Principles we consider essential

- Provenance and citability: where possible, knowledge remains attributable to its original author, organisation, project, or publication and can be traced back to the source.
- No appropriation of knowledge: Chapter 100 connects knowledge; it does not automatically become the owner or author of contributed knowledge.
- Quality and context: knowledge should not be mixed indiscriminately. Appropriate editorial and quality processes should distinguish source material, interpretation, summaries, and derived content.
- Plurality of perspectives: where organisations or disciplines hold different positions, these differences should remain visible rather than being flattened into a single “correct” answer.
- Responsible AI: AI-generated summaries or guidance must remain distinguishable from original sources, and people should be able to inspect the knowledge on which an answer is based.
- Human learning and responsibility: AI may accelerate access and preparation, but it should not replace the social processes through which people understand, discuss, negotiate, and integrate knowledge.
- Long-term stewardship: Chapter 100 should develop a public-interest governance and financing structure that is not dependent on one individual and that can ensure continuity, maintenance, and accountability.

What this Letter of Intent means

With this signature, our organisation expresses an interest in the further development of Chapter 100 and can imagine contributing selected knowledge, experience, or existing materials once an appropriate process has been established. This Letter of Intent does not require us to provide any specific documents, datasets, archives, or rights.

Before organisational knowledge is incorporated, relevant questions concerning selection, licences, publication, attribution, versioning, correction, withdrawal, technical AI use, data handling, and responsibilities will be clarified for the respective contribution or cooperation.

Why this signature matters

Chapter 100 should not be built as a technical platform first and only later ask whose knowledge it contains. The organisations and people who hold and care for knowledge should help shape the conditions under which it is connected. This Letter of Intent makes that shared interest visible while leaving space to define the concrete cooperation responsibly.

We support the laying of foundations for a living, trusted knowledge infrastructure in which practical experience, scientific insight, cultural memory, and local knowledge can become more accessible without losing their origin or integrity.
